

# A New Kind of Fresnel

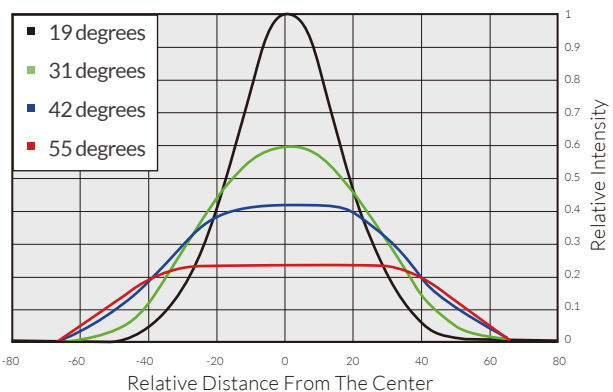

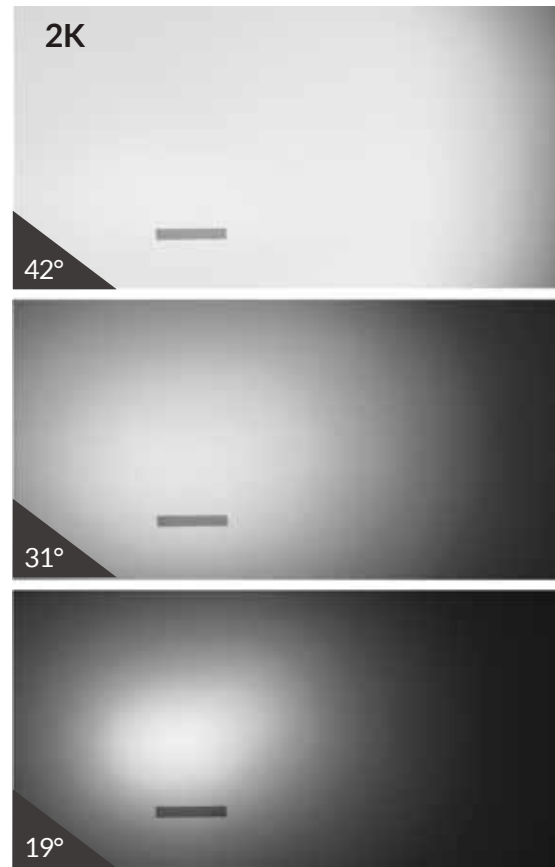

## A Modern Creation of The Classic Fresnel Light

The **Fiilex Q8 Travel** is a revolutionary LED Fixture, and not just because of its Dense Matrix LED technology, superior color quality, and continuous CCT/hue tuning. The **Q8** is a Fresnel light with an extremely wide zoom range and significantly improved light distribution compared to older Fresnels. One glance at our light projection comparisons makes it clear that the **Fiilex Q8 Travel** distributes light more uniformly, displays no visible hot spot, and shows a much more controlled bright/dark transition. This level of performance is maintained at all of its beam angle settings!

## Other LED Fresnels Mimic Old Fresnels

Typical LED Fresnels distribute light similarly to traditional Fresnels. Both technologies concentrate light unevenly towards the center at narrower beam angles.

## A Number on the Spec Sheet does not Tell the Full Story

Some LED Fresnels boast impressive beam ranges on their spec sheets, but when these fixtures are pushed to their narrowest beam angles, the light distribution becomes extremely centralized, making it difficult to evenly light a subject.
